UNIVERSITY COLLEGE OF ENGINEERING(BIT CAMPUS), ANNAUNIVERSITY , TIRUCHIRAPALLI – 620 024

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

BONAFIDE CERTIFICATE

This is to certify this Summer Internship project report **"ONLINE LEARNING MANAGEMENT SYSTEM "** is the Bonafide work of **KATHIRAVAN.P (810023104048)** has satisfactory completed the course of CS**3711 – SUMMER INTERNSHIP** for **SEVENTH** semester, **B.E COMPUTER SCIENCE AND ENGINEERING** during the academic year **2026-2027.**

Faculty Incharge **Head of the department**

Submitted for the practical examination held on _____.

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Fantasy Solution, Trichy, for providing me with the opportunity to undertake my internship and develop the Online Learning Management System (LMS) as part of my Full Stack Development training.

I extend my heartfelt thanks to the management and technical team of Fantasy Solution for their valuable guidance, encouragement, and support throughout the internship period. Their suggestions and assistance helped me understand the practical aspects of web application development and the importance of building efficient, user-friendly, and reliable software systems.

I would also like to thank my project guide and mentors for their continuous support in the development of the Online Learning Management System using Python, Django, MySQL, HTML, CSS, and JavaScript. Their guidance helped me gain practical knowledge of frontend development, backend programming, database management, user authentication, course management, and online assessment functionalities.

This internship provided me with an opportunity to apply my theoretical knowledge to a practical project and improve my technical skills, problem-solving abilities, and understanding of the software development process. It also helped me gain valuable experience in designing, developing, and testing a web-based application.

Throughout the internship, I gained practical knowledge of user authentication, course management, student registration, quiz processing, score calculation, database connectivity, and user interface development. This experience helped me strengthen my programming skills and understand the importance of writing structured, maintainable, and efficient code.

I would also like to acknowledge the importance of the practical assignments and development activities carried out during the internship. These activities improved my analytical thinking, debugging skills, time management, and ability to solve technical problems independently.

Furthermore, this internship helped me understand the importance of teamwork, communication, professional responsibility, and continuous learning in the software development industry. It provided me with valuable exposure to the methods and practices used in developing and maintaining modern web applications.

Finally, I express my sincere thanks to everyone who directly or indirectly contributed to the successful completion of my internship and the Online Learning Management System project. This experience has been both educational and valuable, and I will continue to apply the knowledge and skills gained during this internship in my future projects and career development.

1. DJANGO OVERVIEW

Django is a high-level Python web framework used to build secure, maintainable, and scalable web applications. It provides reusable components for URL routing, request handling, database operations, template rendering, form processing, and user authentication.

Django follows the Model-View-Template (MVT) architectural pattern. Models describe data, views process requests and coordinate application logic, and templates render the user interface. Django ORM allows developers to work with relational databases through Python models.

Key Features of Django

- **Rapid development:** Built-in components reduce repetitive coding.
- **Authentication:** Supports accounts, password hashing, groups, and permissions.
- **Database integration:** ORM and migrations help manage database structures.
- **URL routing:** Maps browser requests to appropriate views.
- **Security:** Provides protections against common web vulnerabilities when configured correctly.
- **Maintainability:** Encourages modular application structure.

Installation Workflow

1. Install Python and create a virtual environment.
2. Install Django and a suitable MySQL database driver.
3. Create a Django project and application.
4. Configure settings, URL routes, models, views, and templates.
5. Configure MySQL and apply migrations.
6. Run the development server and test the application.

2. BENEFITS OF DJANGO

Django is suitable for an Online Learning Management System because it provides a structured framework for managing users, educational content, and assessment workflows.

Faster Development

Django includes reusable components for common web application requirements. This reduces the amount of custom code needed for authentication, routing, forms, and database operations.

Authentication and Permissions

The built-in authentication system supports account handling and permissions. The application can use these features to distinguish student actions from administrator actions. Permission checks must be enforced on the server.

Database Support

Django ORM lets developers create and query database records through models. This makes it easier to work with courses, enrollments, quiz questions, attempts, and marks without writing every query manually.

Maintainability and Testing

A modular project structure makes code easier to organize, test, debug, and update. Separate applications can be created for course management, quizzes, and student progress.

Security Support

Django includes features that help protect against common web risks. Developers must still configure the application correctly, validate inputs, protect credentials, and avoid exposing sensitive information.

Application in This Project

In the LMS, Django can handle login, course requests, quiz submissions, score calculation, and communication with MySQL. The framework helps connect frontend pages with backend functionality in a consistent way.

In the Online Learning Management System (LMS), Django handles user login, course requests, quiz submissions, score calculation, and communication with the MySQL database. The framework connects frontend pages with backend functionality in a consistent and efficient manner. It manages user authentication and authorization to ensure that students and administrators can access their respective features securely.

Django also supports course creation, course enrollment, learning material management, and student progress tracking. It processes user requests and retrieves the required information from the database. The built-in Django admin panel helps administrators manage users, courses, quizzes, and other system data efficiently.

Furthermore, Django follows the Model-View-Template (MVT) architecture, which separates database operations, application logic, and user interface components. This structure makes the application easier to develop, maintain, test, and update. Its security features help protect the application against common web vulnerabilities. Overall, Django provides a reliable backend framework for building a scalable, secure, and user-friendly Online Learning Management System.

Additional Points – Application of Django in the LMS Project

1. User Management: Django helps register new users, manage student accounts, and maintain user profile information.

2. Course Management: It allows administrators to create, update, delete, and organize courses based on different subjects.

3. Student Enrollment: Django processes course enrollment requests and stores enrollment details in the MySQL database.

4. Learning Material Management: It supports the organization and delivery of study materials, notes, documents, and other learning resources.

5. Quiz Management: Django handles quiz creation, question storage, answer submission, and evaluation.

6. Automatic Score Calculation: It processes quiz answers and calculates student scores based on the submitted responses.

7. Progress Tracking: The system can record completed courses, quiz results, and student learning progress.

8. Database Connectivity: Django ORM simplifies communication between the application and MySQL without requiring SQL queries for every database operation.

3. INTRODUCTION TO PROJECT

The Online Learning Management System (LMS) is a web-based application intended to organize online learning activities in a centralized environment. In a fragmented or manual process, students may need to access course information and assessment results from different locations, while administrators may spend time maintaining course and quiz records.

The proposed application provides student and administrator access. Students can browse available courses, access enrolled courses, attempt quizzes, submit answers, and view recorded marks. Administrators can manage course information, create quizzes, and review student performance, subject to the permissions implemented.

Problem Statement

Managing course details, quizzes, student marks, and learning activity separately can make educational administration time-consuming. Students may also find it difficult to review course information and assessment outcomes in a single place.

Proposed Solution

The LMS provides one web-based platform to organize course access, quiz participation, result viewing, and progress information. It is intended to simplify routine learning-management tasks and provide a consistent interface for students and administrators.

Technology Stack

- **Frontend:** HTML, CSS, and JavaScript.
- **Backend:** Python with Django.
- **Database:** MySQL.
- **Optional UI framework:** Bootstrap for responsive layout.

Scope

The core scope includes account access, course information, quizzes, results, and basic progress display. Additional features such as video hosting, certificates, notifications, and AI recommendations are future enhancements rather than assumed current functionality.

The Online Learning Management System (LMS) is designed to provide a centralized platform for managing and accessing educational resources through the internet. The core scope of the project includes user registration, secure login, course information management, quiz participation, result calculation, and basic student progress display.

The system allows students to access available courses, view relevant learning information, participate in online assessments, and review their scores. Administrators can manage user accounts, course details, quiz information, and other essential system data. Django handles the backend operations, while MySQL stores and manages the application data. HTML, CSS, and JavaScript are used to develop an interactive and user-friendly interface.

project aims to simplify learning activities, improve accessibility to educational resources, and reduce the effort required to manage academic information manually. It also provides a structured environment for organizing course-related information and monitoring basic student performance.

The system is intended to be accessible through a web browser, allowing users to interact with the platform from supported devices with an internet or network connection, depending on the deployment configuration.

enhancements may include video-based lessons, downloadable study materials, automated certificate generation, email and in-app notifications, discussion forums, assignment uploads, advanced analytics, and AI-based course recommendations. These features can be incorporated in later versions to improve the learning experience and extend the capabilities of the platform.

current implementation focuses on the essential features required for an effective LMS prototype, while maintaining the flexibility to introduce additional functionalities as future requirements evolve.

4. ABSTRACT

The Online Learning Management System is a web application designed to support course access, online quizzes, result viewing, and student progress monitoring. It aims to provide a centralized platform for students and administrators to manage common learning activities.

The system is designed with separate student and administrator roles. Students can view available courses, participate in quizzes, submit responses, and review their marks. Administrators can manage course details and quiz content and monitor student performance where the relevant functions are implemented.

The application uses Python and Django for backend development, MySQL for database management, and HTML, CSS, and JavaScript for the user interface. Django provides request handling, authentication, and database integration, while MySQL stores records required for course and assessment workflows.

The primary objective is to reduce the complexity of managing learning activities across separate tools and improve access to course information and assessment results. The system provides a foundation that can be extended with video lectures, notifications, certificates, and advanced learning analytics.

Keywords

Online Learning Management System, Django, Python, MySQL, HTML, CSS, JavaScript, Course Management, Online Quiz, Student Progress.

Expected Value

A centralized LMS can make educational information easier to locate and assessment outcomes easier to review. Its actual value should be evaluated through application testing, user feedback, and evidence from the implemented features.

5. PROJECT OVERVIEW

System Architecture

The project follows a typical three-layer web application structure. The presentation layer displays pages and collects input. The application layer processes requests, applies business rules, checks permissions, and coordinates database operations. The data layer stores application records.

Layer	Components	Responsibility
Presentation	HTML, CSS, JavaScript, optional Bootstrap	Displays pages, forms, course details, quizzes, and results.
Application	Python, Django views, URLs, templates, forms	Handles requests, validation, authentication, scoring, and permissions.
Data	MySQL, Django ORM, models	Stores users, courses, enrollments, questions, attempts, and marks.

Main Modules

- **Student module:** Login, course access, quizzes, and result viewing.
- **Administrator module:** Course and quiz management.
- **Course module:** Course titles, descriptions, and related details.
- **Quiz module:** Questions, options, submission, and evaluation.
- **Result module:** Recorded attempts and marks.
- **Progress module:** Completed activities and available progress information.

Integration

The browser sends requests to Django. Django validates the request, applies application rules, uses the ORM to access MySQL, and returns a response to the browser. This integration links the user interface, backend logic, and stored data.

5. PROJECT OVERVIEW (CONTINUED)

Student Workflow

1. The student opens the application and logs in.
2. The application validates the credentials and displays the student dashboard.
3. The student browses available courses and opens a course.
4. The student selects an available quiz and answers its questions.
5. The student submits the quiz responses.
6. The backend evaluates answers using the configured scoring rules.
7. The attempt and score are saved, and the result page displays the marks.

Administrator Workflow

1. The administrator logs in through an authorized account.
2. The system checks administrator permissions.
3. The administrator creates or updates course details.
4. The administrator creates quizzes and enters questions and answer options.
5. The administrator reviews available student attempts and results.

Data Flow

User Interface → Django URL Routing → Django Views and Application Logic → Django ORM → MySQL Database → Response returned to the interface.

Error Handling

The application should handle missing fields, invalid credentials, unauthorized requests, invalid quiz submissions, and database errors. Clear messages help users understand what to do next, while technical error details should not be exposed to end users.

Implementation Note

The workflow above describes the intended system design. Remove or revise any steps that are not supported by the final application.

6. OBJECTIVES

The main objective is to design a centralized online learning application that organizes educational resources and assessment activities.

- **Centralized course access:** Make course information available through one interface.
- **Secure user access:** Support authentication and role-based permissions.
- **Course administration:** Provide authorized course creation, editing, and deletion.
- **Online assessment:** Allow students to answer questions and submit responses.
- **Score calculation:** Calculate marks using predefined answers and scoring rules when configured.
- **Result management:** Store and display quiz attempts and marks.
- **Progress visibility:** Present available information about completed quizzes and learning activity.
- **Database integration:** Organize records using MySQL and Django ORM.
- **User-friendly interface:** Create clear, consistent, responsive pages.

Functional Requirements

Functional requirements describe what the system should do: authenticate users, display courses, manage quizzes, accept submissions, calculate scores, store results, and display relevant records.

Non-Functional Requirements

Non-functional requirements describe qualities of the system: usability, reliability, maintainability, reasonable response time, security, and compatibility with supported browsers and devices.

Success Criteria

The project can be evaluated by verifying that authorized users can complete their intended tasks, that quiz scores are calculated correctly, that records persist in the database, and that users cannot access functions outside their permissions.

1. User Registration and Login: The system should allow users to register, log in, and log out successfully using valid credentials.

2. Authentication and Authorization: Only authenticated users should be able to access protected pages, and access should be restricted according to user roles.

3. Course Management: Administrators should be able to add, update, view, and delete course information successfully.

4. Course Accessibility: Students should be able to view available courses and access the relevant course information without errors.

5. Quiz Functionality: Users should be able to open quizzes, select answers, and submit their responses successfully.

6. Accurate Score Calculation: The system should calculate quiz scores correctly based on the submitted answers and predefined evaluation rules.

7. Database Reliability: User details, course information, quiz records, and results should be stored correctly in the MySQL database and remain available after restarting the application.

8. Data Validation: The application should reject invalid inputs, incomplete forms, and incorrectly formatted data wherever applicable.

9. Progress Tracking: The system should display available student progress information and completed assessments accurately.

10. User-Friendly Interface: The application should provide clear navigation, readable content, and understandable feedback for common user actions.

7. DATABASE DESCRIPTION

MySQL is used as the relational database for storing records required by the LMS. Django models define the data structure, and migrations help maintain the database schema.

Table	Purpose
Users	Stores student and administrator accounts or references Django's user model.
Courses	Stores course title, description, and instructor information.
Enrollments	Records the relationship between students and courses.
Quizzes	Stores quiz title, course association, and settings.
Questions	Stores question text, answer options, correct answer, and scoring details.
QuizAttempts	Records submissions, attempt time, and calculated marks.
Progress	Stores course completion or activity data if a separate progress model is used.

Relationships

A course may contain multiple quizzes. A quiz may contain multiple questions. A student may have multiple quiz attempts. Enrollments connect students to courses. Foreign keys can represent these relationships and help maintain referential integrity.

CRUD Operations

- **Create:** Add course, quiz, question, enrollment, and attempt records.
- **Read:** Retrieve courses, questions, marks, and progress.
- **Update:** Modify permitted course and quiz details.
- **Delete:** Remove authorized records while respecting related-data constraints.

Security and Integrity

Use secure password hashing through Django authentication. Validate input on the server, check permissions before modifying records, protect forms against CSRF, and use appropriate relationships and constraints. Never store passwords as plain text.

8. FRONTEND DESIGN

The frontend is the part of the application that users see and interact with. In this project, HTML structures the pages, CSS controls the visual presentation, and JavaScript adds interactive behavior.

HTML

HTML defines page sections such as navigation, course cards, forms, quiz questions, result summaries, and dashboard content. Semantic HTML improves page organization and accessibility.

CSS

CSS controls typography, spacing, colors, responsive layout, buttons, forms, and cards. A consistent visual design helps students and administrators understand the interface and complete tasks with fewer errors.

JavaScript

JavaScript can support client-side form checks, interactive controls, quiz timers if required, and confirmation messages. Client-side validation improves usability but must be repeated on the server because browser checks can be bypassed.

Responsive Design

The layout should adapt to desktop, tablet, and mobile screens. Flexible containers, readable font sizes, adequate contrast, and usable controls can improve accessibility across devices.

Suggested Interface Pages

- Home page with a brief overview and navigation.
- Login and registration pages.
- Course listing and course details pages.
- Quiz participation page.
- Result page showing score and attempt information.
- Student dashboard and administrator dashboard.

Usability Considerations

Labels should be clear, errors should explain how to correct a problem, and navigation should remain consistent. Important actions such as quiz submission should be easy to identify. Any screenshots in the final report should be captured from the actual application.

1. Simple Interface: The LMS should provide a clean and organized interface so that students and administrators can use the application without confusion.

2. Clear Labels: Buttons, menus, form fields, and navigation links should have meaningful labels that clearly describe their purpose.

3. Consistent Navigation: The navigation structure, menu placement, colors, and button styles should remain consistent across all pages.

4. Readable Content: Text should use appropriate font sizes, spacing, and contrast to improve readability and reduce eye strain.

5. Easy Login Process: The login page should provide clearly labeled username and password fields, along with helpful messages for invalid credentials.

6. Form Validation: Required fields should be identified, and users should receive immediate feedback when they enter incomplete or incorrect information.

7. Helpful Error Messages: Error messages should explain what went wrong and suggest how to correct the problem instead of displaying technical error details.

8. Visible Action Buttons: Important actions such as login, course enrollment, quiz submission, and logout should be easy to locate.

9. Quiz Submission Confirmation: The system should clearly communicate when a quiz has been submitted successfully. A confirmation step can help prevent accidental submissions.

10. Result Presentation: Quiz scores and assessment results should be displayed in a clear format so students can understand their performance easily.

8. BACKEND DEVELOPMENT AND AUTHENTICATION

The backend manages the application's rules and processes requests from the frontend. Django URLs route requests to views, views coordinate application logic, models represent stored data, and templates display information.

Django Models

Models define the fields and relationships used to store course, quiz, question, attempt, and result data. Migrations translate model changes into database schema updates.

Views and URL Routing

Views process requests and return responses. URL patterns map paths such as course lists, quiz pages, and result pages to their corresponding views. Templates render dynamic content based on data retrieved by the backend.

Authentication

Django authentication can support account creation, login, logout, password hashing, and user permissions. The application should verify the user's identity before showing protected information.

Role-Based Access Control

Student accounts should access student functions, while administrator functions should be restricted to authorized accounts. Permission checks must be applied to backend views and data operations, not only to the navigation menu.

Validation and Error Handling

The backend should validate required fields, ensure quiz identifiers are valid, check that submissions belong to the correct user, and handle unexpected errors. User-facing messages should be helpful without revealing internal system details.

Session and Data Protection

Use secure settings for deployment, protect secrets, configure CSRF protection, and use HTTPS in production. Database credentials should not be committed to public repositories.

8. QUIZ, RESULTS, AND PROGRESS TRACKING

Quiz Module

The quiz module presents questions and answer options associated with a course. Students select their answers and submit the completed quiz. The backend validates the submission and evaluates responses using predefined correct answers and scoring rules.

Score Calculation

A basic scoring method awards marks for each correct answer and combines them into a total score. The exact formula should follow the quiz rules. The backend should calculate the result rather than trusting a score submitted by the browser.

Quiz Attempts

A quiz attempt record can store the student, quiz, submission time, selected answers or response details, and calculated score. The design should define whether students may retake quizzes and how repeated attempts are displayed.

Result Module

The result page can display the quiz title, score, maximum marks, submission status, and attempt details. Students should only be able to view their own results unless additional permissions are granted.

Progress Tracking

Progress indicators can be derived from enrolled courses, completed quizzes, scores, and course completion records. Progress should reflect actual stored activity rather than static or fabricated percentages.

Testing Considerations

- Verify scoring for all-correct, all-incorrect, and partially correct responses.
- Check that duplicate or invalid submissions are handled according to the rules.
- Verify that results are saved and can be retrieved after logging in again.
- Check that one student cannot access another student's private results.
- Test empty submissions, invalid question IDs, and server-side validation.

8. SYSTEM DASHBOARD AND WORKFLOW

Student Dashboard

The student dashboard acts as a starting point for course and assessment activities. Depending on the implemented features, it may display enrolled courses, available quizzes, completed assessments, recent marks, and progress indicators.

Administrator Dashboard

The administrator dashboard provides access to management functions. It may display course counts, quiz records, student attempts, and performance summaries where those metrics are supported by stored data.

High-Level Workflow

Step	Action	System Response
1	User opens the application	Displays the public or login page.
2	User submits credentials	Django authenticates and checks permissions.
3	User opens a dashboard	Displays role-appropriate features.
4	Student opens a course or quiz	Retrieves authorized course or quiz data.
5	Student submits answers	Validates responses and calculates score.
6	Result is saved	Stores the attempt and score in MySQL.
7	Student views result	Displays the saved result and available progress.

Dashboard Evidence

Insert the actual student dashboard and administrator dashboard screenshots here if available. Each figure should include a number, caption, and short explanation of what the screen demonstrates.

9. TESTING AND VALIDATION

Testing helps determine whether the LMS functions correctly, protects user information, and stores data consistently. The following test cases are examples and should be marked as passed or failed only after they have been executed.

Test Case	Test Activity	Expected Result
TC-01	Login with valid credentials	User is authenticated and redirected appropriately.
TC-02	Login with invalid credentials	Access is denied and a suitable message is shown.
TC-03	Open course listing	Available course records are displayed.
TC-04	Create or update a course as admin	Authorized changes are saved.
TC-05	Submit a quiz	Responses are validated and evaluated.
TC-06	Review a saved result	The correct stored score is displayed.
TC-07	Attempt unauthorized admin action	The action is blocked.
TC-08	Check persistence after logout/login	Saved data remains available to authorized users.
TC-09	Submit incomplete or invalid form	Validation prevents invalid data from being accepted.

Validation Areas

- Functional testing: verify core pages and user workflows.
- Database testing: check relationships, saved records, and retrieval.
- Security testing: verify authentication and permissions.
- Usability testing: check clarity, navigation, and responsive layout.
- Regression testing: re-test key features after bug fixes.

9. PROJECT OUTCOMES AND SKILLS GAINED

Expected Outcomes

- **Centralized access:** Course information can be presented in one place.
- **Course administration:** Authorized administrators can manage learning content.
- **Online assessment:** Students can submit quiz answers electronically.
- **Result viewing:** Recorded marks can be made available to students.
- **Progress visibility:** Stored course and quiz activity can support progress summaries.
- **Organized data:** MySQL can maintain related application records.

The outcomes above describe the intended capabilities of the system. The final report should distinguish between features successfully implemented, features partially implemented, and features planned for future work.

Technical Skills

- Python programming and Django application development.
- HTML structure, CSS styling, and JavaScript interactions.
- MySQL database design and CRUD operations.
- Django ORM, models, migrations, and database connectivity.
- Authentication, permissions, and input validation.
- Testing, debugging, error handling, and technical documentation.

Professional Skills

- Requirement analysis and task planning.
- Breaking a project into modules and manageable tasks.
- Documenting design decisions and test results.
- Reviewing issues and making improvements based on testing.

Problem Solved

The project addresses the challenge of managing courses, quizzes, marks, and learning activity through separate or manual processes. A centralized web application can simplify access and improve organization for students and administrators.

10. CONCLUSION

The Online Learning Management System demonstrates how full-stack web technologies can be combined to create a centralized platform for online educational activities. The application is designed to bring course access, quiz participation, result viewing, and progress information together in one system.

Django provides the backend framework for application logic, authentication, and database operations. MySQL stores application records, while HTML, CSS, and JavaScript provide the user interface and interactive features.

The project provides practical experience in web application structure, database integration, user access management, form handling, and testing. Its final effectiveness depends on successful implementation and validation of the features described in the report.

11. FUTURE ENHANCEMENTS

- Video lectures and downloadable study materials.
- Course completion certificates.
- Email notifications and assessment reminders.
- Course search, filtering, and categorization.
- Performance charts and advanced learning analytics.
- AI-assisted course recommendations.
- Discussion forums and live classes.
- Improved accessibility and mobile-responsive layouts.
- Learning analytics to identify areas where students may need support.

Final Remarks

The LMS provides a foundation for organized online learning. Further development and user testing can help improve its reliability, usability, and usefulness for different learning environments.

APPENDIX A: 30-DAY INTERNSHIP WORK SCHEDULE

This is a proposed schedule. Edit the activities to match the actual internship work completed.

Day	Activity
1	Project orientation and understanding the problem statement.
2	Requirement analysis and identification of user roles.
3	Install Python, Django, MySQL, and a code editor.
4	Explore Django structure and create the project.
5	Design homepage using HTML and CSS.
6	Create course listing and course detail layouts.
7	Review frontend layout and responsive styling.
8	Study Django URLs, views, and templates.
9	Create models for courses and related records.
10	Configure MySQL database connection.
11	Implement student registration and login, if in scope.
12	Configure administrator access and role permissions.
13	Develop course create, update, and delete operations.
14	Test authentication and database operations.
15	Design the quiz module and quiz page.
16	Create quiz question and answer option structures.
17	Develop quiz participation workflow.
18	Implement quiz submission and score calculation.
19	Save quiz attempts and marks in the database.
20	Create the result viewing page.
21	Test quiz submission and scoring rules.
22	Design the student dashboard.
23	Display enrolled courses and completed quizzes.
24	Implement progress indicators based on recorded data.
25	Improve styling and JavaScript interactions.

26	Validate forms and handle application errors.
27	Test student and administrator workflows.
28	Fix bugs and verify database consistency.
29	Capture screenshots and prepare documentation.
30	Conduct final review, demonstration, and report preparation.

Fantasy Solution

Find ur Passion...

Date: 28.05.2026

Kathiravan P,
Reg.No: 810023104048,
Department of Computer Science and Engineering,
University College Of Engineering,
Bharathidasan Institute of Technology (BIT) Campus,
Tiruchirappalli - 620 024.

Dear Kathiravan,

Sub: Internship

On behalf of **FANTASY SOLUTION**. We would like to inform you that you have been accepted as one of our interns. We are pleased to inform you that you have been accepted as per the company requirements for the internship with **Full Stack Development**.

Your internship wil l begin from **01st June 2026 to 30th June 2026**. You would assign to various tasks which relates to the project assigned to you after whom your performance would be assessed and appraised.

FANTASY SOLUTION TRICHY-1

Authorized Signature

Certificate of Accomplishment

This is certify that Mr./Miss. KATHIRAVAN p (8100281040 48)

Student of UNIVERSITY COLLEGE OF ENGINEERING BIT CAMPUS ANNA UNIVERSITY - TRICHY

underwent Inplant Training / Internship / Course on FULL STACK DEVELOPMENT

concern from 01/06/2026 to 30/06/2026 issued on 30/06/2026

Technical Incharge

Manager

CEO

FANTASY SOLUTION TRICHY

ANNEXURE

Internship (June – July 2026)

1. **Name of the Industry with address:** Fantasy Solution - 16, Samrath Plazza, Third Floor, Madurai Main Rd, Melapudur, Tiruchirappalli, Tamil nadu 620 001

2. **Name of the Industrial Expert (Joint Supervisor):** Mohamed farook.

3. **Qualification of the Industrial Expert (Joint Supervisor):** CSE.

4. **Designation of the Industrial Expert (Joint Supervisor):** Software developer.

5. **Title of the Project Work:**

ONLINE LEARNING MANAGEMENT SYSTEM

6. **Duration of the Internship:** 01/06/2026 - 30/06/2026

7. **Details of the student:**

Sl. No.	Name of the student	Registration No.	Department
	P. Kathiravan	810023104048	CSE

Terms and conditions

- The student is permitted to undergo a semester long internship in your organization
- The student shall be instructed to meet the Institute supervisor periodically and to attend the review committee meetings for evaluating the progress.
- The final report of the internship duly signed by the industrial expert/supervisor will be submitted to college.
- Attendance Certificate in the prescribed format signed by the competent authority of the industry will be produced
- Internship Certificate in the prescribed format signed by the competent authority of the industry will be produced

Signature

Seal of the Organization
